## 1. Travel System Overview:

The travel eCommerce system suits just perfect for all the travel agencies across the world. Plan a perfect travel for your customers inclusive of event tickets and hotel packages through this tour management system. Whether you want to plan leisure, event or business trips for your customers, this holiday booking system is just ideal for you. Although our travel eCommerce system is comprised of several features, yet we can customize it as per your requirements. Here are the default features of our eCommerce travel planning system.

This travel management system serves as a 'travel wiki'! It is the ocean of information about the travel places, events happening around, places of interest, tickets to the events, accommodation, hotels, prices and payment information. All the information can be provided to customers systematically, in the separate tabs, so as to give them an easy and quick access to it. Your customers might want to take a look at the famous places of interests in various cities or the events happening in a particular city. If they decide upon a city or an event, they might want to buy a ticket for that event and book a room in a hotel. Apart from that, they might want to know different types of accommodation and the type of payments that they opt for. This is the one-stop travel eCommerce solution for your customers to seek all the information at one place.

This feature lets you assist your customers in planning to attend an event. Once the customer seeks all the information about an event and decides about attending one, you can help him book his ticket through this online ticket booking system.

All the tickets are generated from the third party through ticket evolution integration. The backend travel management is done with ticket system integration like Ticket Evolutions.

### 1.1.6. Check out

This part is very interesting as the checkout is smart enough to understand the details to ask for. Of course, it asks for the billing and shipping address and shows shipping information. However, it also asks for traveler information and type of bed, as per the number of travelers the customer had selected during selection of the hotel. If customer has booked three rooms, all these information will be asked three times. At the end, it will ask for the credit card details and then show the checkout review. Once everything is filled, customer can click on Place Order.

### 1.1.7. Order Success

The Order success page contains all the details on the page itself, instead of just displaying thank you message, so that customer can confirm if all the details are correct.

### 1.1.8. Backend

All the above mentioned features were frontend features. However, all these features also exist in the backend. So, the customized order creation can be done from the backend. Also, the admin can edit the orders.
